# AIRSAN TYPE V

## Permanent • All Metal • High Efficiency • Viscous Impingement Air Filter

Airsan Type V filters are highly efficient all-metal air filters designed specifically to protect ventilated electronic and electrical cabinetized equipment.

These filters offer low initial resistance, large dust holding capacity and are easily cleanable with any commercial solvent

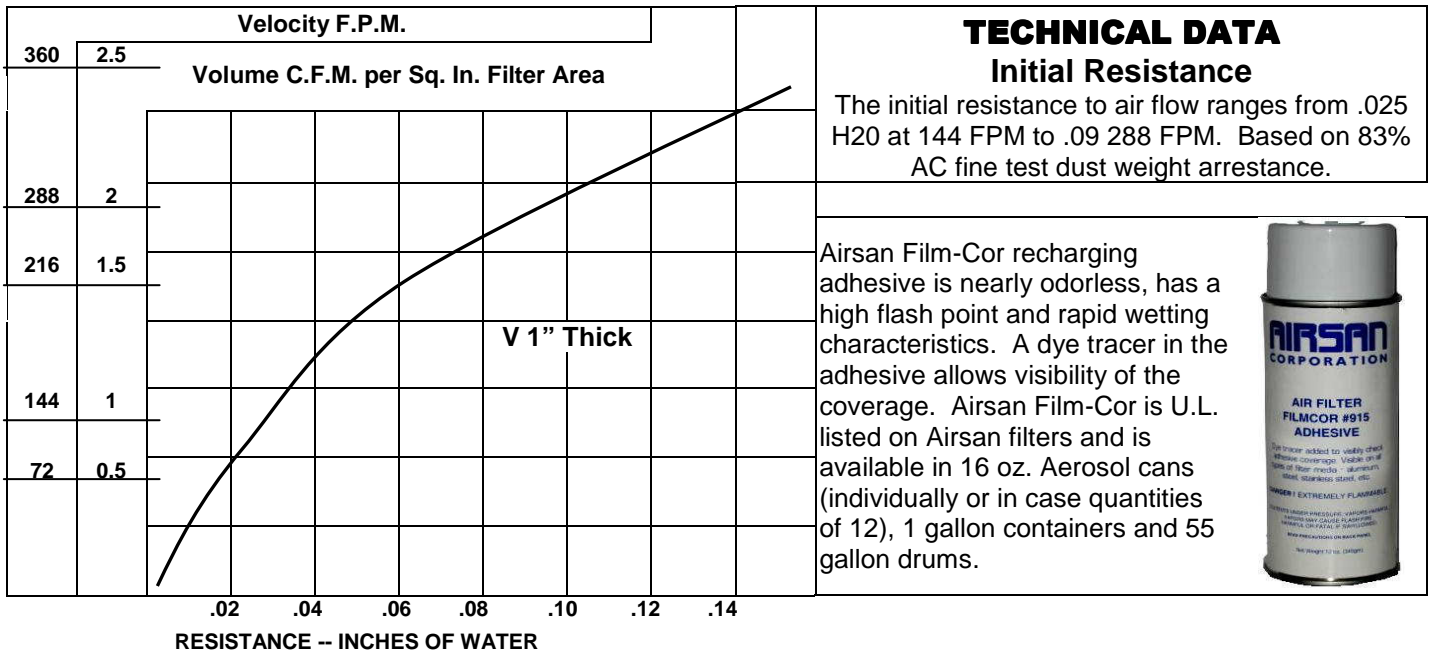

Type V filters are recharged with AIRSAN Film-Cor adhesive. All viscous impingement (oil-wetted) type air filters require the use of adhesive for maximum efficiency and dust holding capacity.

The all metal construction withstands vibration and shock. Media cannot settle or change density and efficiency remains constant. They are not affected by changes in temperature or climatic conditions. RF shielding can be provided. These filters meet Mil. Spec. F-F300B.

Filter media is a viscous impingement type, consisting of multiple layers of crimped and flat screen cloth arranged for maximum dust holding capacity. AIRSAN offers media depth consistent with the thickness of the frame. This design allows maximum contact area, which increases filter performance.

Type V filters can be manufactured in any rectangular size required in thicknesses of 1/4", 1/2", 3/4" 7/8" and 1". To determine size of filter, use a factor of 2 CFM per sq. in. of filter area. Customer designed filters can be provided to meet your specific requirements.

Type V air filters are available in Aluminum (VAA), Stainless Steel, Bronze (VBB), Monel (VMM) and Galvanized Steel (V). Aluminum type VAA may be plated to specifications when required. AIRSAN filters are also available with dry media (Type KK) which requires no adhesive.
